USSR/Medicine - Brucellosis

Sep/Oct 53

"Changes in the Function of the Cardiovascular System of Patients Affected with Brucellosis,"

V. N. Leyman, Cand of Med Sci, Chair of Infectious Diseases, Kuybyshev Med Inst

Terap Arkh, Vol 25, No 5, pp 40-47

This subject remains a controversial question in modern USSR medical science. Clinical observations revealed numerous disturbances of cardiovascular functions in a large percentage of the observed brucellosis patients. The severity of these disturbances progressed with the course of the disease,

276T13

and in some instances resulted in organic defects of the vascular system and the cardiac muscles. These observations have been confirmed by postmortem programs, and exams, X-ray observations, electrocardiograms, and some hemodynamic indices, pulse, arterial and venous pressure, velocity of the blood flow, etc.

103. Cardiovascular Activity Studied in Brucellosis Patients

"Venous Pressure and Rate of Blood Flow in Brucellosis Patients," by V. N. Leyman, Trudy Kuybishevskogo Meditsinskogo Instituta (Works of the Kuybishev Medical Institute), 1954, pp 282-290 (from Sovetskoye Meditsinskoye Referativnoye Obozreniye, No 20, 1956, pp 53-54, abstracted by K. Gorbunova)

"Fifty brucellosis patients in various stages of the disease process were examined. Clinical methods of investigation, such as roentgenoscopy, electrocardiography, measurements of arterial and venous blood pressure, and determination of the rate of blood flow, were employed. Enlargement of the heart was noted in 58% of the persons examined; enlargement of the vascular fasciculae, in 30%; dulling and muffling of heart sounds, in 72%; systolic noise, in 8%; and accentuation of the second sound in the pulmonary artery, in 4%. Electrocardiographic investigation revealed change in the rhythm of cardiac contractions in 48% of the patients. A change in the T wave was noted in almost all the patients examined. Deflection of the heart axis to the left was observed in 58%; and to the right, in 26%. The relative stability of maximum and minimum blood pressure and instability of pulse pressure at different stages and phases of the

brucellosis infection process were noted. Venous pressure in brucellosis patients is irregular. The rate of blood flow is ostensibly retarded depending on the extent to which the brucellosis process has progressed. Analysis of the data obtained led to the conclusion that the functional activity of the cardiovascular system undoubtedly depends on the stage of development of brucellosis infection in a considerable percentage of brucellosis patients." TITLE: Theoretical Problems Concerning the Broaching of Bodies of Revolution With  
the Aid of Plane Broaches 18

PERIODICAL: V sb.: Novoye v konstruir. metallorezh. instrumentov. Moscow, Mashgiz,  
1958, pp 141 - 166

ABSTRACT: The authors elucidate some theoretical problems of the free and restricted  
broaching of bodies of revolution with plane broaches. The condition of  
free broaching was studied in considering problems of the cutting motion  
trajectory, cross-section size of the chip, irregularity of geometrical  
shape of the machine part, trajectory angle of ascent, and cutting angles.  
Correcting calculations are presented in connection with the manufacture  
and blade grinding of the plane broach. For restricted broaching conditions  
the following problems were investigated: cross-section geometry of the layer  
to be removed, deformations of the geometrical shape of the part machined and  
cutting angles. 18 figures.

TITLE: A sorption vacuum pump. Class 27, No. 183878

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 14, 1966, 60

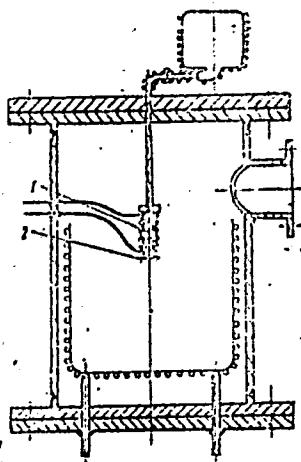

TOPIC TAGS: vacuum pump, sorption, titanium, stainless steel, alkali metal

ABSTRACT: This Author's Certificate introduces: 1. A sorption vacuum pump which contains a vessel with alkali metal used as a getter; and a means for cleaning the metal. The pump is simplified and purification of the alkali metal from volatile impurities is facilitated while simultaneously increasing the rate of evacuation of the pump by using a metal diaphragm as the means for purification of the alkali metal. This diaphragm covers the vessel so that only the alkali metal can escape. 2. A modification of this pump in which the diaphragm is made from stainless steel. 3. A modification of this pump in which the diaphragm is made from titanium.

The exchange capacity of the different components of humus and their complexes. Z. Ya. Lein. *Trans. Dokl. chesk. Soil Inst. (U. S. S. R.)* 23, 65-81 (in English, 81-6) (1940).—L. points out that fresh plant residues contg. a relatively high lignin, cellulose and hemicellulose content, such as rye straw, sawdust, have a low exchange capacity. In the soil org. matter the exchange capacity depends on its components which are not investigated as such, except for the lignin complexes to which the origin of humus in the soil has been referred to by Fisher and Schroeder. The lignin-protein complex has been investigated by Waksman and Lyer (*C. A.* 27, 6180) who attributed the exchange capacity of humus to this complex. L. subjects the work on the lignin-protein complex to an exptl. search from the angle of the exchange capacity of the component parts of humus and their complexes, namely: (1) several substances of plant residues; lignin, protein, xylan, tannins; (2) substances isolated from humus; humic acid and bitumens; (3) complexes obtained by combining the substances of 1 and 2. After giving in detail the methods of prep., the substances enumerated and the sources where some of these substances were obtained, L. presents the data on their exchange capacity. Humic acid has an exchange capacity of 451.6 milliequiv. per 100 g. and 449.8 when treated with 0.1 N NaOH; tannin is next in order—225.4 and 242.4 (without and with the NaOH); soybean protein—55.9 and 62.5; xylan—20.8 and 22.5; acid lignin—10.2 and 33.0; alk. lignin—9.8 and 118.3; bitumen—21.2. Thus lignin has the power to increase its exchange capacity upon treatment with NaOH and in this respect differs from humic acid which is not affected by NaOH. L. found that the no. of methoxyl groups is the same in the lignins treated with NaOH or untreated. It is suggested that the NaOH oxidized certain

substances, such as carbonyl groups, and thereby increases the exchange capacity. Combinations of lignin and protein were investigated and the conclusions reached, after showing the errors involved in the method of Waksman and Lyer, that the nucleus of humus is not the lignin-protein but the humic acid. It is suggested that in order to increase the exchange capacity of a soil it is not pertinent to increase the lignin-protein complex, but to allow org. matter, such as manure and other org. substances, to become humified.

TITLE: Mechanized Surfacing of Worn Components of Farming Machines  
(Mekhanizirovannaya naplavka iznoshennykh poverkhnostey detaley  
sel'skokhozyaystvennykh mashin)

PERIODICAL: Sb. dokl. nauch.-tekhn. konferentsii svarshchikov. Kiyev-Moscow,  
Mashgiz, 1955, pp 144-151

ABSTRACT: A study of the technology whereby components (made of carbon or low-alloy structural steels) which had become unserviceable owing to abrasive or thermal wear are restored to service by means of mechanized automatic surfacing. Optimal chemical composition (0.40% C, 0.35% Si, 1.70% Mn, 2.24% Cr, 0.029% S, and 0.049% P) of the metal deposited was established for components which, when in operation, are subjected to abrasive wear, impact, and crushing. A numerical evaluation of the effect of preliminary heating on the hot-cracking susceptibility of metal deposited, depending on its C content, is presented in the form of a graph showing the instantaneous rate of cooling at 1350°C vs. permissible C content in the

Card 1/2

SOV/137-57-1-951

Mechanized Surfacing of Worn Components of Farming Machines

metal deposited. Recommendations are given on various techniques and methods of surfacing employing welding wires Sv-30KhGSA and Sv-18KhGSA in conjunction with fluxes AN-348A, OSTs-45A, and AN-20. Several methods of mechanizing the process of surfacing with the aid of a semiautomatic PSh-5 unit combined with metal lathes or milling machines are described and examples of surfacing of articles of small diameters (45-50 mm), such as the bogies and the drive sprockets of the S-80 tractor, are given.

Formation of heat cracks in weld beads. R. I. Leynachuk  
and V. V. Podgaetskii. *Avtom. Svarka* 6, No. 1, 17-24  
(1955).—The permissible C content in filler metal is de-  
pendent upon the preheating temp. of the part and the speed  
of oxidation of the deposited metal. Data are presented on  
the variation of temp. through the layers of deposited metal.  
Graphs are included to show (1) that the max. C for pre-  
venting heat cracks increases from 0.24% to 0.47% as the  
preheat temp. is increased from room temp. to about 500°;  
(2) that the max. C decreases as the instantaneous speed  
of oxidation increases. J. R. Behrman

Title : Effect of carbon on abrasion resistance of hard facings.

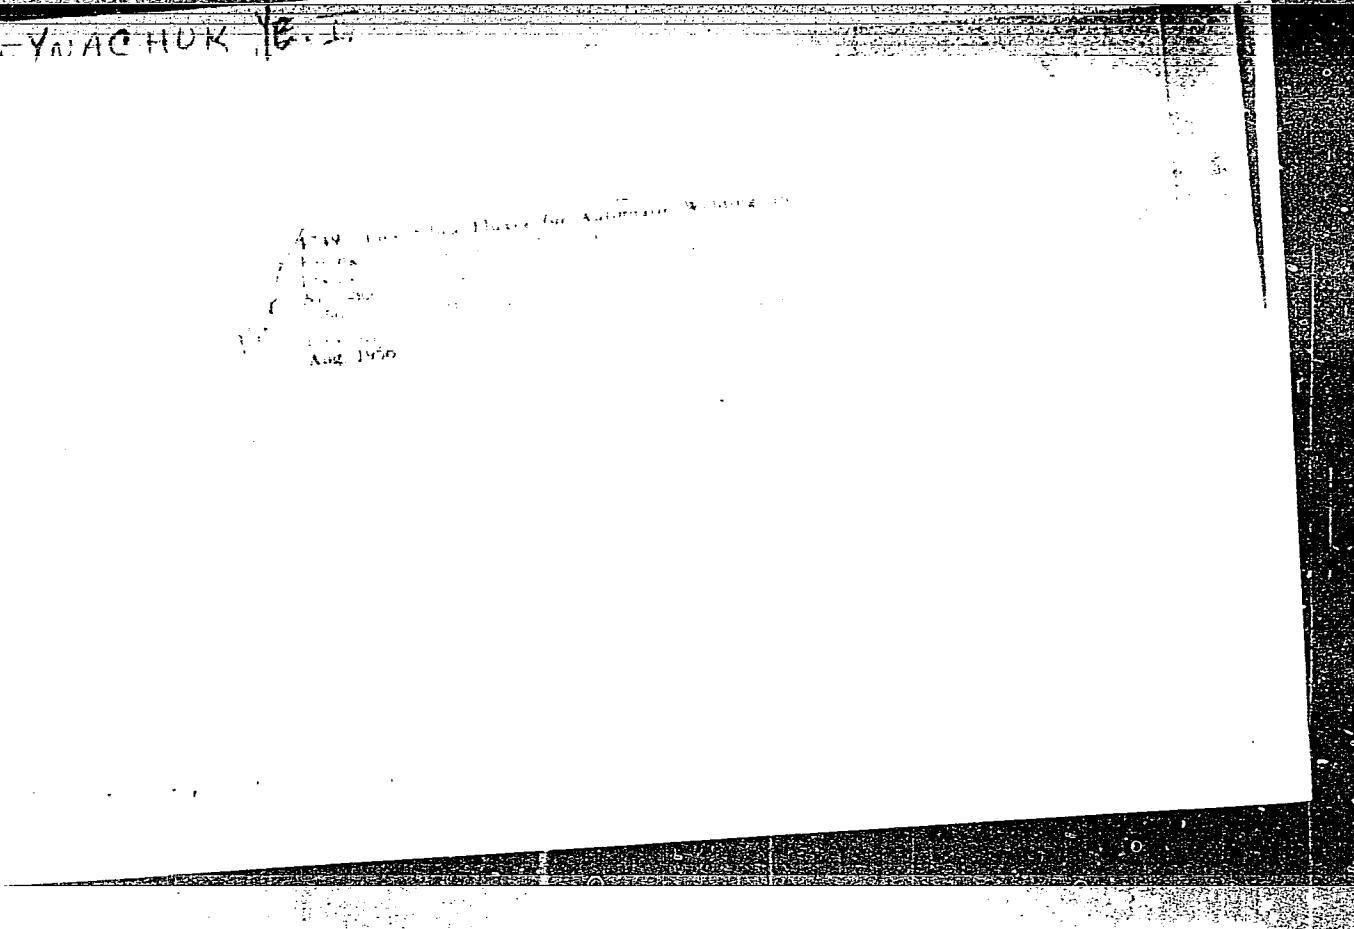

Periodical : Avtom.. svar., 3, 58-64, Mr 1956

Abstract : The author presents results obtained from research for better abrasion-resistant materials. He concentrated on hard facings containing 0.17 to 2.54% of carbon, since it was found that the abrasive resistance of hard facings with a carbon content beyond 2.2% does not improve. Four tables, 4 graphs, 2 drawings and photo. Ten Russian references (1931-55) and 2 American references (1948-49).

ABSTRACT:

Flux Production for Automatic Welding in the German Democratic Republic (Proizvodstvo flyusov dlya avtomaticheskoy svarki v Germanskoy Demokraticeskoy Respublike)

Avtomaticheskaya Svarka, 1958, # 1, pp 91-95 (USSR)

Automatic welding under flux in the German Democratic Republic is being used for building of ships, machines, tubes, boilers, railway-cars, etc, although manual arc welding is still the main method in this field.

There are factories, however, where 3 - 5 automats for welding are utilized; the Bitterfelde Tube Plant, for example, has 10 automats.

In the German Democratic Republic, a centralized flux production of two types was organized: sintered fluxes at the Weisswasser Glass Plant (since 1952), and fused fluxes at the Piesteritz Chemical Combine (since 1955). Both flux types are applicable for the welding of low carbon steel. Flux production amounts to 1,000 - 1,200 tons per year. The price is 1,050 German Marks or 1,890 rubles per ton. The production of fused fluxes is increasing and it is expected that fused fluxes of the type AH-348-A will be widely

Card 1/2

125-1-15/15

Flux Production for Automatic Welding in the German Democratic Republic

applied in automatic welding. For this purpose manganese ore must be imported. MP-18 is one of the sintered flux types. The smelting of fluxes is carried out in a single-phase electric furnace, producing on the average 2 tons every 24 hours. A special workshop was constructed at the Weisswasser Plant for the production of sintered fluxes.

A new composition of low siliceous medium-manganese sintered flux was developed, named P-82. The mass production of this type will be started in 1957. Moreover, sintered fluxes have been devised, which have chemical compositions, similar to the AH-20 and AH-8M types.

The forthcoming production of AH-348-A and ОСЦ-45 type fluxes is being planned and research is being conducted in regards to the composition of alloyed fluxes.

The article contains 5 tables and one diagram.

Fusion of Flux for Automatic Welding in Electro-Furnace  
Model DS-0,5 (Vyplavka flyusa dlya avtomaticheskoy  
svarki v elektricheskoy pechi tipa DS-0.5)

PERIODICAL:

Avtomaticheskaya svarka, 1959, Vol 12, Nr 3, pp 78-85  
(USSR)

ABSTRACT:

The author gives an exact description of the three-phase electro-furnace DS-0,5, together with a drawing (Fig.1) and electro and thermostat diagrams (Fig. 2 and 3). The furnace was developed in 1949 as a result of an urgent demand. When continuously in operation it has a capacity of 1500-1600 tons per year or 400-600 tons per course. A new feature of this furnace is the metal mold replacing the graphite coating used so far. The measurements of this mold are given in Fig. 5. The chemical composition of the steel used (steel 45) is given. A photograph of the metal structure of this steel is shown in Fig. 4a. The mold has to be chilled continuously by

water. Input temperature 18°, output temperature 30-40°.  
Another chapter deals with the granulation of the fusion  
of flux by water, the necessary time, etc. There are 6  
diagrams, 2 photographs and 3 Soviet references.

TITLE:

Method of Investigating the Abrasion of Metals at  
Elevated Temperatures

PERIODICAL: Zavodskaya laboratoriya, 1960, Vol. 26, No. 6, pp. 754-756

TEXT: A device is described for performing laboratory tests of the abrasion wear of fused on metals at temperatures up to 700°C. In this device (Fig. 1) the sample is pressed by means of a loaded lever on a rotating circular wire brush (65 N (G) wire, diameter 0.6 mm). Sample and brush are placed in a closed casing, and at its bottom the abrasion agent (granite sand of a grain size of 1-3 mm). By turning the brush (120, 240, or 480 rpm) the abrasion agent is whirled up and brought onto the rubbing surface of the brush on the sample. On the sample (Fig. 2) there is an opening for the introduction of a thermocouple. The application of the test method described is exemplified by abrasion tests on parts of the charging apparatus of blast furnaces and other parts which are exposed

COVERAGE: The collection contains abridged reports presented and discussed at the Twelfth Annual Assembly of the International Institute of Welding. Reports deal with problems of welding and related processes used in repair work, repair techniques, and the problems arising in connection with the nature of the base and filler materials. Examples of repairing various parts are given, and the organization of repair operations in workshops and under field conditions is discussed. Economic aspects of welding and related processes as used in repair work are analyzed. No personalities are mentioned. There are no references.

AUTHORS: Leynachuk, Ye. I., Grabchak, A. T.

TITLE: Nichrome facing of steel

PERIODICAL: Avtomaticheskaya svarka,<sup>14</sup> no. 4, 1961, 71 - 77

TEXT: The article presents brief general information on the properties of nichrome-type alloys and the results of building-up experiments that have been carried out to find out the suitable fluxes for build-up welding. Multilayer coatings were deposited on MCr.3 (MSt.3) steel using X15H60 (Kh15N60) and X20H80 (Kh20N80) wire 2 mm in diameter, direct current with inverse polarity, 230 - 250 amp, 29 - 31 v, and 22 m/min welding speed. The following flux grades were tested: AH-28 (AN-28), AH-20 (AN-20), AH-Φ5 (AN-F5), 48-Φ6 (48-OF-6), AH-Φ8 (AN-F8), AH-Φ17 (AN-F17), AH-30 (AN-30) and AH-348A (AN-348A). All listed fluxes corresponded to the standard specifications. [Abstracter's note: The chemical composition of the fluxes is not given]. The suitability of flux was evaluated by the stability of the arc, shape of deposited bead, separation of the slag crust, and the presence of cracks, pores or other flaws. The appearance of beads and microstructure are shown in photographs. The chemical composition of metal deposited with the use of all

Card 1/2

27035

Nichrome facing of steel

S/125/61/000/004/009/013  
A161/A127 X

fluxes is given in tables. The weld metal was tested for mechanical properties and for high-temperature oxidation resistance. Fluxes 48-OF-6, AN-F8 and AN-F17 are recommended for application, but only the 48-OF-6 grade is already being produced by the industry. The 48-OF-6 flux produced less well-shaped beads than the other fluxes, but the metal deposited with it had a disoriented austenitic structure without cracks. Conclusions: 1) Nichrome facing of steel is advisable when the part surface has to be refractory or corrosion-proof. 2) The 48-OF-6, AN-F8 and AN-F17 fluxes are recommended for hardfacing with nichrome wire. The deposited metal is sound. 3) The mechanical properties of faced Kh15N60 and Kh20N80 nichrome at 800°C are not lower than the properties of forged or rolled nichrome. 4) Built-up Kh15N60 nichrome is 65 to 125 times more resistant to scale formation than low-carbon steel, and the resistance to scale formation of Kh20N80 nichrome is even higher. There are 4 figures, 6 tables and 4 Soviet-bloc references.

Vest.mash. 41 no.4:23-27 Ap '61. (MIRA 14:3)  
(Cranes, derricks, etc.)

LEYNER, F., starshiy inzh.

Effect of the boom system on the swinging gear of the gantry crane  
boom. Mor.flot 21 no.2:12-15 F '61. (MIRA 14:6)

1. Otdel mekhanizatsii Zhdanovskogo porta.  
(Electric cranes)

LEYNER, F., inzh.

Modernization of cable drums. Mor. flot 22 no.2:16 F '62.  
(MIRA 15:4)

1. Zhdanovskiy port.  
(Cranes, derricks, etc.)

KIYANOV, I.; LEYNER, F.; MALEYEV, L., kand. tekhn. nauk, dotsent

Loading and unloading of asphalt and bitumen by grab cranes. Mor.  
flot 23 no.10:14-16 0 '63. (MIRA 16:10)

1. Glavnyy tekhnolog tresta Donbassprommontazh (for Kiyanov).  
2. Nachal'nik TSentral'nykh remontno-mekhanicheskikh masterskikh  
Zhdanovskogo porta (for Leyner). 3. Zhdanovskiy metallurgicheskiy  
institut (for Maleyev).

(Bituminous materials—Transportation)  
(Cranes, Derricks, ect.)

STANISLAVSKIY, G.; LEYNER, F., kand. tekhn. nauk

Largest transportation center of the Sea of Azov. Mor. flot 25  
no.11:12-13 N '65. (MIRA 18:11)

1. Zamestitel' nachal'nika Zhdanovskogo porta (for Stanislavskiy).

LEYNER, F.M.

Single-phase braking of the turning drive of a traveling gantry crane.  
Prom.energ. 16 no.5:27-29 My '61. (MIRA 14:7)  
(Cranes, derricks, etc.)

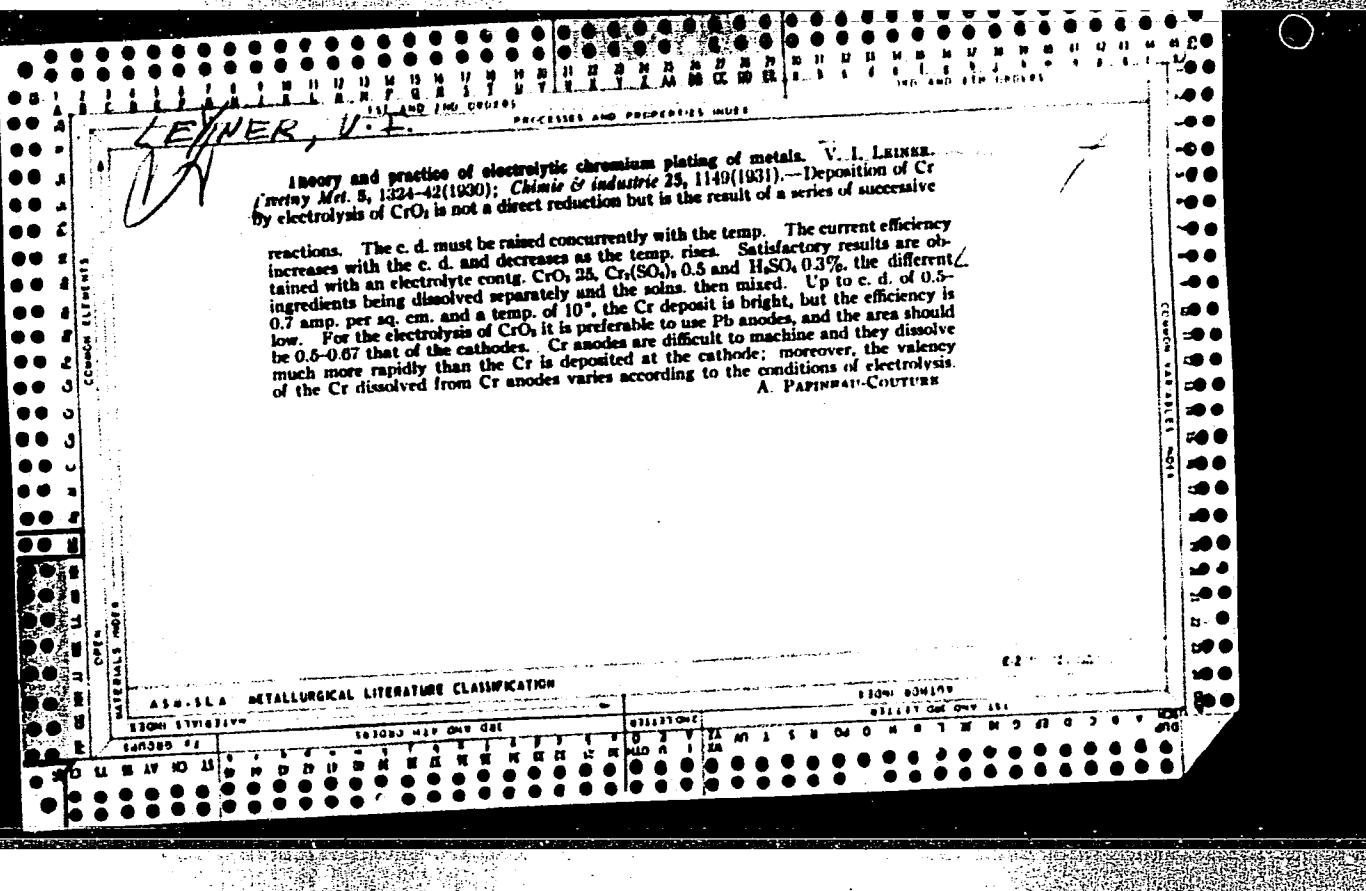

LEYNER, F.M.

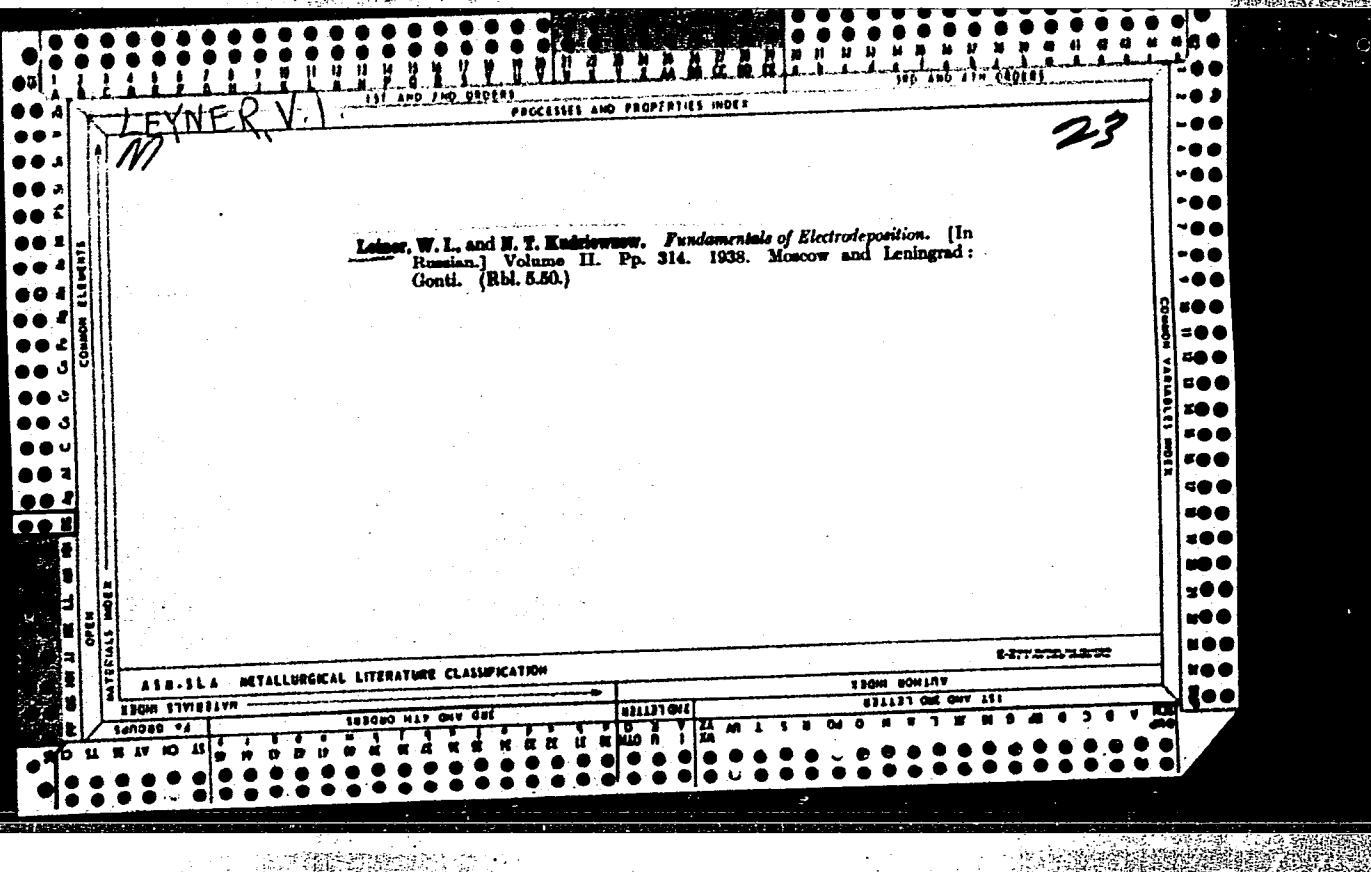

Experimental determination of the angle of deflection from the  
vertical of hoist ropes by the method of photogrammetry. Trudy  
TSNIIMF 7 no. 32:107-111 '61. (MIRA 14:5)  
(Cranes, derricks, etc.) (Photogrammetry)

LEYNER, F.M., inzh.

Balanced jib systems without counterweights. Izv.vys.ucheb.zav.;  
mashinostr. no.8:72-90 '61. (MIRA 15:1)

1. Leningradskiy institut vodnogo transporta.  
(Cranes, derricks, etc.)
